

Settlement Processing Procedure

Standard Flow

Validate trade → validate SSI → generate settlement instruction → send to custodian/market infrastructure → receive status → monitor until settled.

Rejected Instruction

Check rejection code, settlement account, place of settlement, counterparty SSI and security eligibility. Correct reference data and resubmit when permitted.

Cutoff

Client-specific cutoff rules override the generic operations cutoff when an active client configuration exists.

Error Code	Description	Typical Action	Priority
SET001	Missing SSI	Check static data	High
SET002	Invalid settlement account	Validate account	High
SET003	Insufficient securities	Check position	Medium
SET004	Counterparty mismatch	Contact counterparty	High
